Morphine Equivalent Daily Dose Policies

Previous research indicates that patients who receive higher doses of prescription opioids have an increased risk of overdose and mortality, leading several states to establish Morphine Equivalent Daily Dose (MEDD) thresholds. MEDD is a measurement that converts opioid prescriptions to their equivalent dose in morphine and divides the total prescription by the number of days the prescription is intended to last, allowing for comparison among different opioid formulations and strengths. This dataset contains cross-sectional information on threshold levels, policy characteristics, and sponsoring organizations in effect as of June 1, 2017. The jurisdictions selected for measurement are the 50 states and the District of Columbia.

This codebook should be used in conjunction with the statistical data extract that can be downloaded from the dataset homepage by clicking on the Data button. There are four standard variables in every LawAtlas dataset. They are:

JURISDICTION:
This is a dropdown selection in each coding form. It includes the jurisdictions coded in the dataset.

EFFECTIVE DATE:
This date (MM/DD/YYYY) is the most recent effective date of the legal text captured for this place. The effective date represents the date the policy coded was put into effect.

VALID THROUGH DATE:
This date (MM/DD/YYYY) is the last date the policy was in effect as reflected by the legal text captured to code this policy.

LEGAL TEXT:
This is a text box that captures all legal text relevant to the coding questions. This will not download into Microsoft Excel.
